Prevalence of Serious Mental Illness and Substance Use Disorders

Dr. Michael K. Champion, Medical Director, Hawaii Department of Health, Adult Mental Health Division

*Millions of people in the United States are living with Serious Mental Illness (SMI) and Substance Use Disorders (SUD), and many do not receive the treatment they need.*

**SERIOUS MENTAL ILLNESS**

Adults with any mental illness are classified as having SMI if they have any mental, behavioral, or emotional disorder that substantially interferes with or limits one or more major life activities. SMI includes disorders such as bipolar disorder, major depressive disorder, schizophrenia, and schizoaffective disorder. In 2020, the percentage of adults in the U.S. with SMI grew to 5.6%, or 14.2 million people (up from 3.7%, or 8.3 million people, in 2008). 1

**SERIOUS MENTAL ILLNESS IN THE PAST YEAR: ADULTS AGED 18 OR OLDER: 2008-2020**

Note: There is no connecting line between 2019 and 2020 to indicate caution should be used when comparing estimates between 2020 and prior years because of methodological changes for 2020. Due to these changes, significance testing between 2020 and prior years was not performed.
**SUBSTANCE USE DISORDERS**

SUDs are characterized by impairment caused by the recurrent use of alcohol or other drugs (or both), including health problems, disability, and failure to meet major responsibilities at work, school, or home. In 2020, 40.3 million people aged 12 or older (14.5% of this population) had an SUD in the past year.¹

**PEOPLE AGED 12 OR OLDER WITH A PAST YEAR SUBSTANCE USE DISORDER (SUD): 2020¹**

Note: The estimated numbers of people with substance use disorders are not mutually exclusive because people could have use disorders for more than one substance.

**CO-OCCURRING DISORDERS**

Among adults aged 18 or older, the percentage with both SMI and an SUD was 2.2%, or 5.7 million people, in 2020.¹

**UNTREATED SERIOUS MENTAL ILLNESS AND SUBSTANCE DISORDERS**

Among the 14.2 million adults aged 18 or older in 2020 with past-year SMI, 64.5% received inpatient, outpatient, or prescription medication treatment. This left 5.0 million people, or 35.5%, without treatment.

Among people aged 12 or older in 2020 who had a past-year SUD, only 6.5%, or 2.6 million people, received any substance use treatment. This left 37.7 million, or 93.5%, without treatment.

**GROUP DISPARITIES IN THE PREVALENCE AND TREATMENT OF SMI**

In 2020, the prevalence of SMI was disproportionately higher among women than among men and disproportionately higher among some racial and ethnic groups. The prevalence of SMI was also highest in the 18-25-year age group.²
PAST-YEAR PREVALENCE OF SERIOUS MENTAL ILLNESS AMONG U.S. ADULTS: 2020

*Persons of Hispanic origin may be of any race; all other racial/ethnic groups are non-Hispanic.

Treatment of SMI also varied significantly among different gender, racial/ethnic, and age groups.²

MENTAL HEALTH TREATMENT RECEIVED IN PAST YEAR AMONG U.S. ADULTS WITH SMI: 2020

*Persons of Hispanic origin may be of any race; all other racial/ethnic groups are non-Hispanic.
MENTAL ILLNESS IS OVERREPRESENTED IN THE COURTS

People living with SMI or SUD are overrepresented in the criminal legal system. One recent study examined SMI and SUD diagnoses among arrestees in Indiana. It found that in the 2 years before being arrested, nearly one-third (31.3%) of arrestees had a mental health diagnosis, and over a quarter (27.7%) of arrestees had an SUD diagnosis. These rates are substantially higher than the rates found in the general population, as described above. The study also found that arrestees with multiple mental health, SUD diagnoses, or co-occurring conditions in the preceding 2 years had significantly higher odds of repeat arrest.

People living with mental illness are also overrepresented in the courts and in the incarcerated population. The rate of serious mental illness is four to six times higher in jail (14.5% of men and 31% of women in jails) than in the general population. Substance use disorders are even more prevalent than serious mental illnesses in jails and prisons, 68% of people in custody in jails, 53% of people in custody in state prisons, and 46% of people in custody in federal prisons report symptoms consistent with SUD in the year prior to their incarceration.

State courts need better data on justice-involved people living with SMI and SUD. The National Center for State Courts published a Behavioral Health Data Elements Interim Guide, which begins to lay out the data elements needed to thoroughly understand and evaluate the courts’ processing of cases involving behavioral health issues. NCSC is currently developing the updated version of the Behavioral Health Data Elements Guide.
